Topic: ZERO TRUST SECURITY FRAMEWORK FOR MICROSERVICE ARCHITECTURE DRIVEN WEB APPLICATIONS

Domain: Cybersecurity – DevOps

Members: Dinesh Kumar.N (ch.en.u4cys21014)
V. Jayaraj (ch.en.u4cys21026)

Supervisor: Dr. S. Udhayakumar
CSE- Cybersecurity

Problem Identification

- Traditional authentication and authorization mechanisms often rely on perimeter-based security, which fails to protect against internal threats and lateral movement within containerized environments.
- Increasing use of cloud services and remote work has expanded the attack surface, making it difficult to secure data and applications effectively.
- The complexity and scale of managing permissions and access controls in containerized and microservices architectures expose vulnerabilities.

Problem Statement

- The current reliance on perimeter-based security fails to provide the necessary protection for data and applications in the context of expanding cloud services and remote work, necessitating a shift to a Zero Trust Architecture.
- Zero Trust Architecture addresses these gaps by enforcing strict identity verification, continuous monitoring, and least-privilege access, significantly enhancing security in dynamic and distributed container deployments.

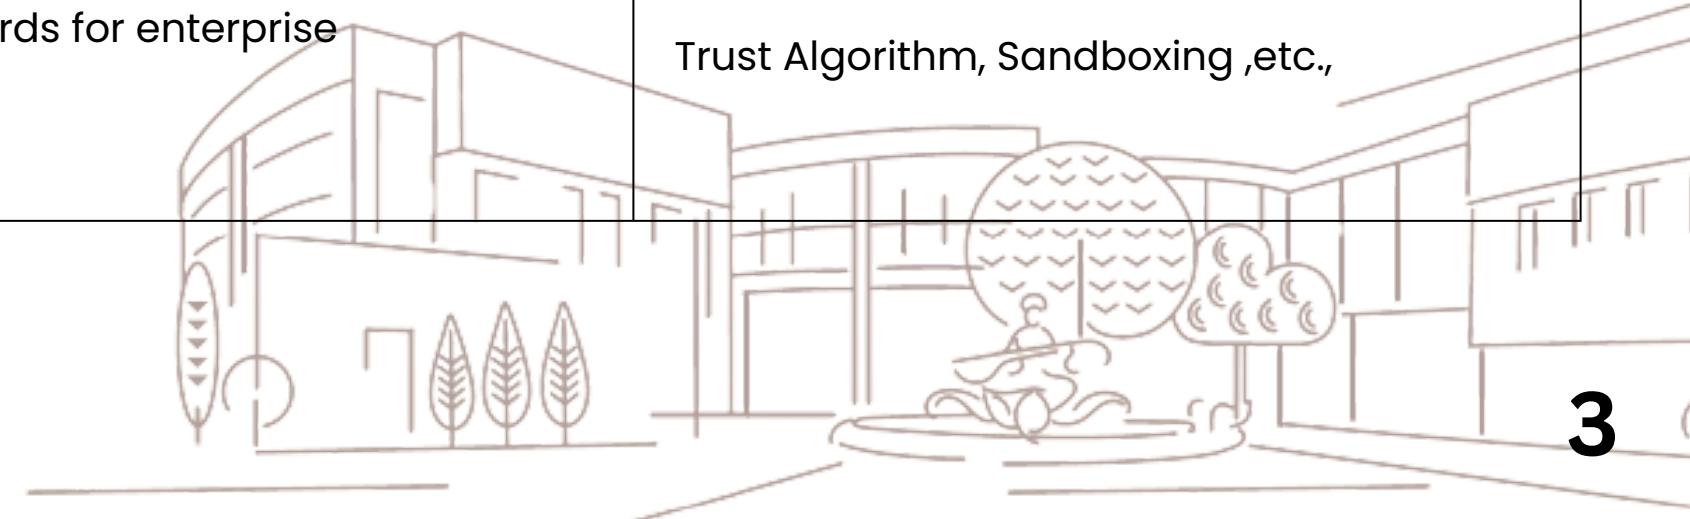

Literature Review

S.NO	Title and Author	Objective	Algorithms/Techniques
1	Building A Zero Trust Architecture Using Kubernetes Daniel D'Silva; Dayanand D. Ambawade, published in IEEE: 2021 I2CT	Use containers to build a Zero Trust Architecture providing authentication with Least Privilege	Attribute based access control, JSON Web Token
2)	Establishing a Zero Trust Strategy in Cloud Computing Environment Saima Mehraj; M. Tariq Banday, published in IEEE: 2020 ICCCI	Propose a Zero Trust strategy to enhance trust establishment between customers and cloud service providers	Multi Factor Authentication, Mapping Data Flow, Microsegmentation
3)	Authentication and authorization orchestrator for microservice-based software architectures A. Bánáti1 , E. Kail1 , K. Karóczkai1 and M. Kozlovszky1 MIPRO 2018	Investigating the different types of authentication and authorization methods in order to implement our solution for a healthcare application.	OAuth2, SSO, JWT and OpenID
4)	Securing a Cloud-Native C2 Architecture Using SSO and JWT Ryan Melton, 2021 IEEE Aerospace Conference	To implement Zero Trust Architecture on Command and Control application named COSMOS in kubernetes cluster	Istio (mTLS), JWT, KeyCloak, SSO
5)	Zero Trust Architecture Scott Rose Oliver Borchert Stu Mitchell Sean Connelly NIST Special Publication 800-207	Define Zero Trust Architecture standards for enterprise organizations	Trust Algorithm, Sandboxing ,etc.,

Zero Trust Security Framework for Microservice Architecture Driven Web Applications

N. Dinesh Kumar

V. Jayaraj

Project Significance

- Implementing Zero Trust Architecture (ZTA) in containerized environments is crucial for enhancing security.
- By implementing least-privilege access and continuous monitoring, organizations can better protect their sensitive data and applications from evolving threats.
- Containers are inherently ephemeral and dynamic, making traditional perimeter-based security ineffective.
- ZTA benefits organizations, DevOps teams, and IT security professionals by improving security posture, ensuring regulatory compliance, and enabling efficient, secure deployments, thus promoting safer and more resilient infrastructure.

Tech Stack Used

Frontend: React js -- TailwindCSS -- Redux

Big Data: Apache Spark -- PySpark -- mlib

Backend: Python -- flask -- Node js

DevOps:

- Docker
- Kubernetes – AWS EKS
- Helm Chart
- Git

Database: MongoDB /AWS DynamoDB

ZTA Features: JWT -- mTLS -- Falco -- R8

Android App: React Native -- Java

Objective

- Design and implement a Zero Trust Architecture that enforces strict identity verification and continuous monitoring, ensuring that every access request within containerized environments is authenticated and authorized.
- Develop mechanisms for least-privilege access, ensuring that users and applications have only the permissions necessary for their tasks, minimizing the risk of unauthorized actions.
- Integrate advanced security measures that protect against internal and external threats, ensuring a robust and resilient security posture in dynamic containerized environments.

Scope

To Evaluate current security.

Develop a Zero Trust framework for containers, integrate continuous identity verification and access controls.

Develop a POC for ZTA in web and android applications, conduct testing, provide documentation.

Gartner

Gartner Director Analyst Afraz Jaffri. "Early adoption of these innovations will lead to significant competitive advantage and ease the problems associated with utilizing AI models within business processes."

WE LIVE PROGRESS

AI in the workplace: The good, the bad, and the algorithmic

While AI can liberate us from tedious tasks and even eliminate human error, it's crucial to remember its weaknesses and the unique capabilities that humans bring to the table

Imogen Byers

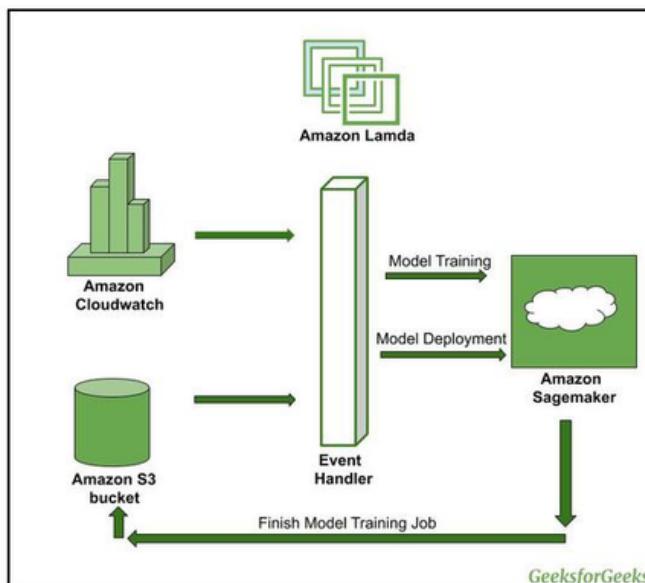

The most effective approach to cybersecurity is not to rely solely on AI or humans but to use the strengths of both. This could mean using AI to handle large-scale data analysis and processing while relying on human expertise for decision-making, strategic planning, and communications. AI should be used as a tool to aid and enhance your workforce, not replace it.

Cloud Provider

Service

Key Features

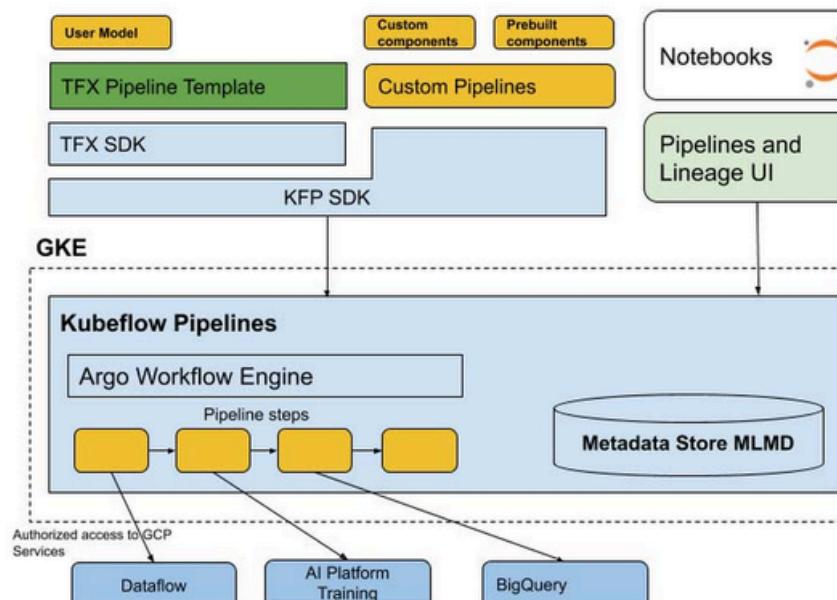

Advantages

SageMaker

- End-to-end machine learning platform
- Build, train, and deploy models in a distributed manner
- Supports algorithms like XGBoost
- Pre-built models for common use cases
- Auto-scaling and resource provisioning

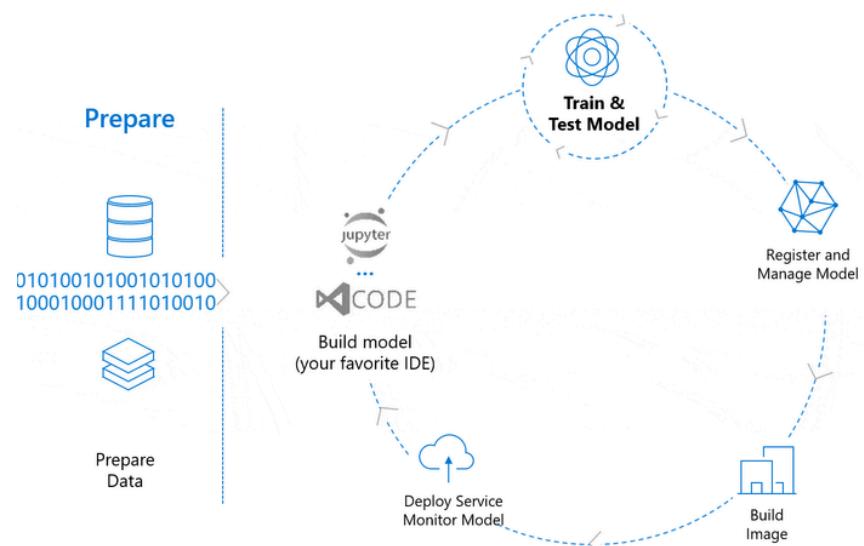

- Comprehensive ML capabilities
- Automatic scaling
- Widely used algorithms support

Vertex AI Platform

- Custom model training
- Hyperparameter tuning
- TensorFlow integration for global prediction serving
- Seamless integration with Google's cloud infrastructure

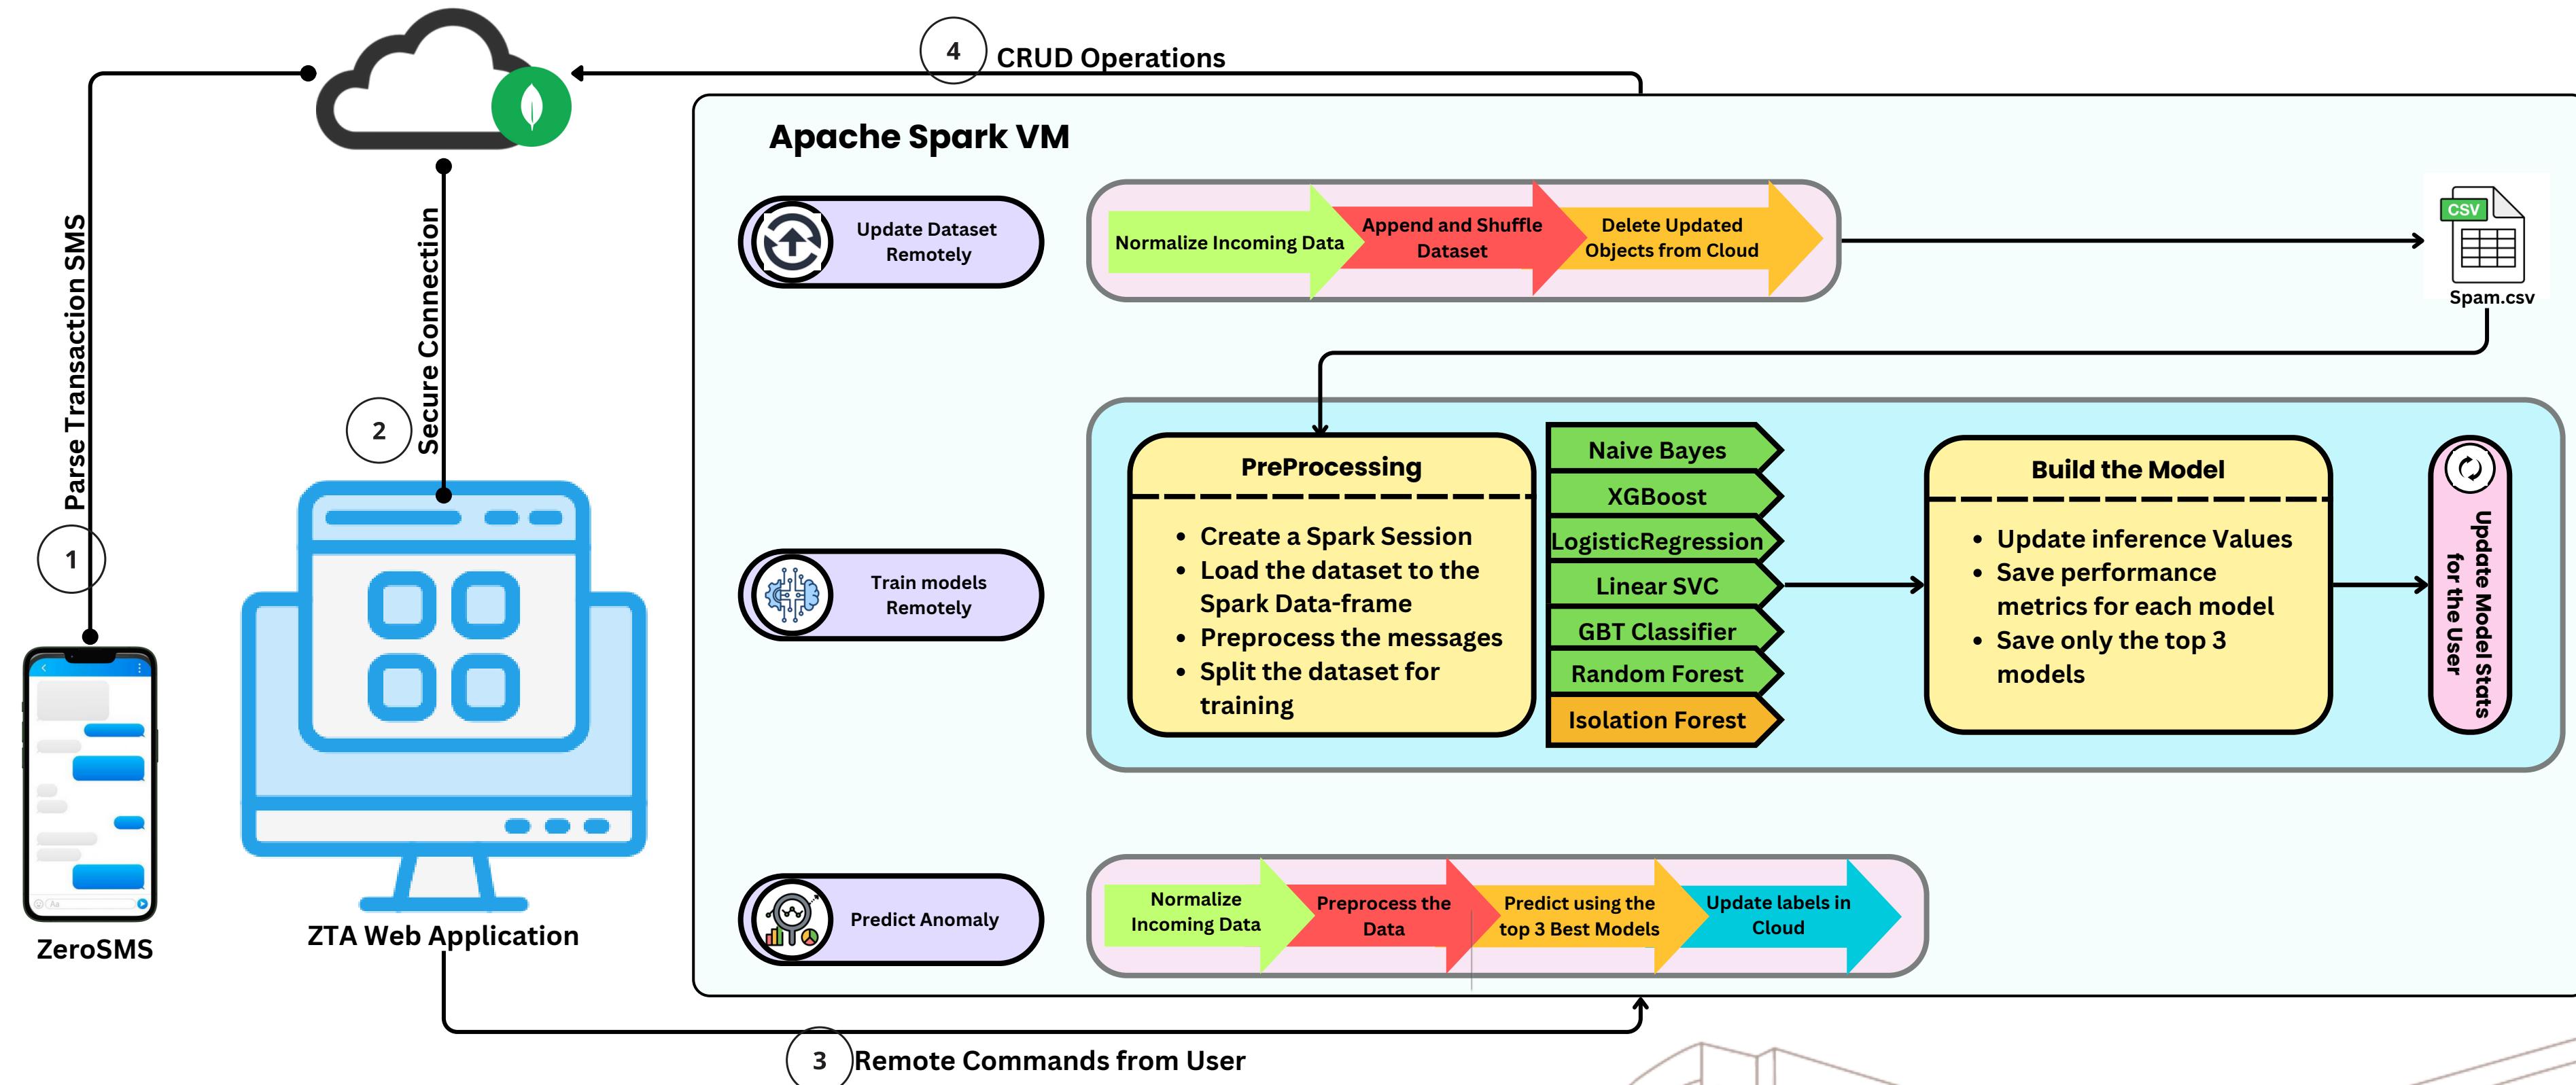

- Advanced TensorFlow support
- Flexible training options
- Efficient hyperparameter tuning

Azure Machine Learning

- Simplified pipelines for data ingestion, model training, deployment, and monitoring
- Integration with Jupyter Notebooks and Microsoft Power BI

- Ease of use
- Strong integration with Microsoft ecosystem
- Productivity-focused tools

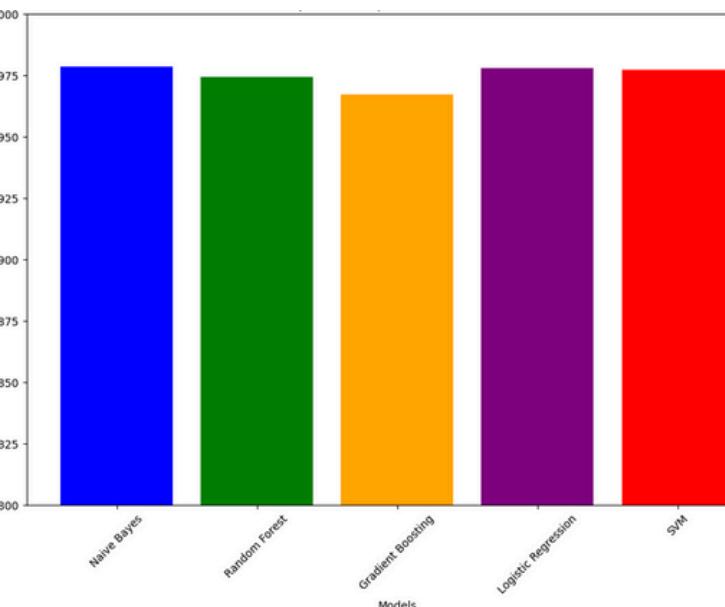

Results and Analysis

The web application, deployed on an EKS cluster with node groups, ensures scalability, fault tolerance, and seamless service communication for a smooth user experience. The user dashboard supports secure CRUD operations, while data sharing with auditors provides selective access. Auditors have read-only access to transactions, and the admin dashboard allows dynamic role assignment and access control.

Security is enhanced using AWS Lambda and Falco, which monitor the cluster for anomalies and trigger real-time alerts for threat detection. Session logs offer a comprehensive audit trail, tracking user activities and ensuring compliance with Zero Trust principles by continuously monitoring user actions.

Naive Bayes was the best model with an F1 score of 0.918 and accuracy of 0.978, showing a strong balance of precision and recall. SVM had the highest precision (1.0) and ROC AUC score (0.984), while Logistic Regression also performed well with an F1 score of 0.909. Random Forest and Gradient Boosting had slightly lower F1 scores but maintained high accuracy across all models.

Results and Analysis

To prepare for production release, the app leverages the JailMonkey library to detect rooting and unsafe environments, while utilizing R8 and ProGuard tools for code optimization and obfuscation to enhance performance and security. The APK is securely signed with a private key from a trusted keystore, ensuring authorized distribution.

The below figures compares and tests ZeroSMS APK against standard APKs. Due to R8 and ProGuard obfuscation, reverse engineering ZeroSMS is significantly more challenging. A MobSF scan shows ZeroSMS achieving a security score of 57 (Grade B), 83.87% higher than a standard APK, which scored 31 (Grade C). ZeroSMS has SMS permissions and allows "http" traffic for backend connectivity, impacting its security score.

```
signingConfigs {  
    debug {  
        storeFile file('debug.keystore')  
        storePassword 'android'  
        keyAlias 'androiddebugkey'  
        keyPassword 'android'  
    }  
    release {  
        if (project.hasProperty('MYAPP_UPLOAD_STORE_FILE')) {  
            storeFile file(MYAPP_UPLOAD_STORE_FILE)  
            storePassword MYAPP_UPLOAD_STORE_PASSWORD  
            keyAlias MYAPP_UPLOAD_KEY_ALIAS  
            keyPassword MYAPP_UPLOAD_KEY_PASSWORD  
        }  
    }  
}  
buildTypes {  
    debug {  
        signingConfig signingConfigs.debug  
    }  
    release {  
        // Caution! In production, you need to generate your own keystore file.  
        // see https://reactnative.dev/docs/signed-apk-android.  
        signingConfig signingConfigs.release  
        debuggable false  
        shrinkResources true  
        minifyEnabled true  
        proguardFiles getDefaultProguardFile("proguard-android.txt"), "proguard-rules.pro"  
    }  
}
```

Conclusion and Future Work

This project demonstrated the application of Zero Trust principles to enhance security in containerized environments through a proof of concept (PoC) that included a secure web application, Python API, and Android app. Key strategies such as JWT authentication, continuous monitoring, root detection, mTLS within containers, and Role-Based Access Control (RBAC) were implemented. The outcomes emphasize the importance of trust verification at every layer and proactive monitoring to significantly mitigate security risks in modern containerized systems.

Future efforts can focus on integrating advanced threat detection using machine learning to identify anomalies in containerized applications. Automating security audits and incorporating continuous vulnerability scanning in CI/CD pipelines will strengthen ongoing security assessments. Additionally, providing Zero Trust training for developers will promote a security-first mindset. Real-world deployments of these solutions in varied organizational settings would offer insights into improving security measures and adapting strategies to evolving cyber threats.

ZERO TRUST SECURITY FRAMEWORK FOR MICROSERVICE ARCHITECTURE DRIVEN WEB APPLICATIONS

INTRODUCTION AND OBJECTIVE

In today's digital landscape, traditional security models fall short against modern cyber threats. As organizations move to cloud-native architectures, the attack surface grows, increasing vulnerability. The Zero Trust Security Model addresses these risks by enforcing continuous authentication, strict access control, and encryption. This project aims to implement a secure web application using Zero Trust principles, focusing on identity verification with JWT and mTLS, adaptive access control, encrypted communication, and real-time threat detection.

ALGORITHM TO IMPLEMENT ZTA

- Authenticate User
 - a. Validate Credentials
 - b. Assign Role
- Enforce Least Privilege
 - a. If authorized, grant minimal access
 - b. Else, deny access
- Request Access to Resource
 - a. Verify Token and Permissions
 - b. Log Access if valid, else deny
- Secure Containers
 - a. Initialize and Secure Kubernetes
 - b. Deploy Containers with mTLS
- Monitor and Detect Threats
 - a. Audit Activity
 - b. Detect Anomalies
- Encrypt Data at Rest and In Transit
- Implement Real-Time Threat Response
 - a. AI/ML for proactive threat detection
 - b. Automate incident response for detected anomalies

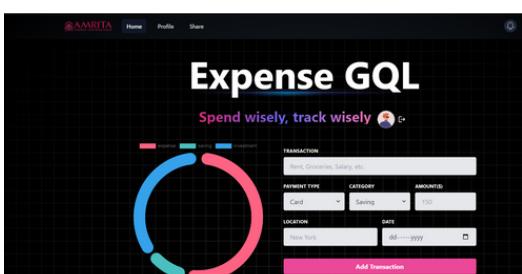

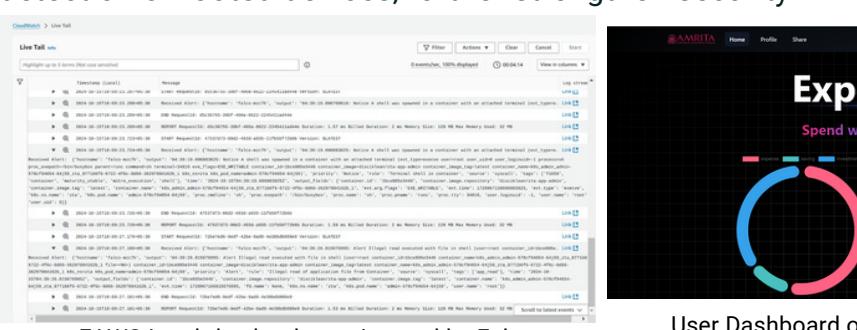

METHODOLOGY

The system integrates a mobile Android app, web application, and security module following Zero Trust principles. The Android app parses SMS data for transaction information, while the web application handles user management, transactions, and applies security policies.

Security protocols include:

- JWT Authentication for secure user sessions.
- mTLS for encrypted communication between services.
- Policy Enforcement Point (PEP) for real-time access control.
- Falco for real-time threat monitoring via system calls.

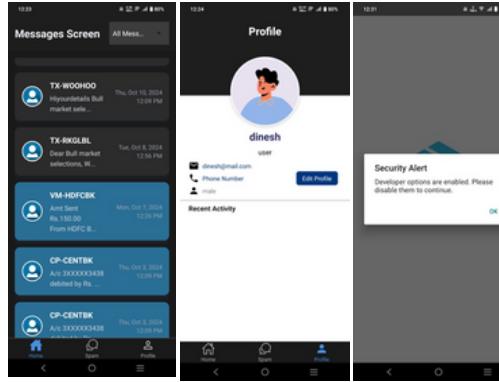

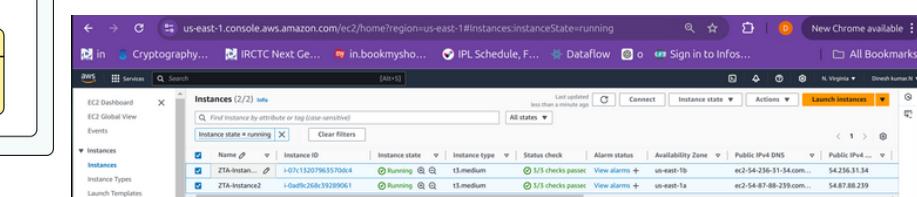

Roles like Admin, Auditor, and User are defined to manage access and operations securely. Additional measures, such as code obfuscation and detection of rooted devices, further strengthen security.

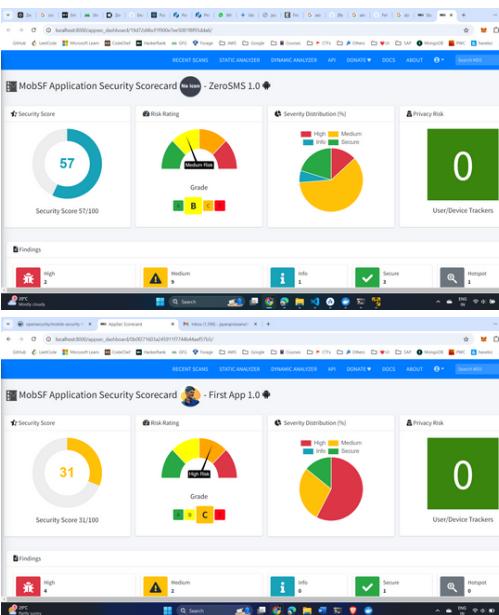

User Dashboard of the deployed application

RESULT ANALYSIS

The web application is designed to efficiently manage personal and business financial transactions by enabling users to manually input and track their expenses, savings, and investments in an organized manner. In addition to manual entry, the app offers seamless synchronization of transactions through SMS parsing using the integrated ZeroSMS app, ensuring that users can automatically log financial activities received via text messages. To help users better understand their financial status, the application provides detailed visual insights through interactive charts and graphs, allowing for easier monitoring of spending patterns, savings growth, and investment performance. The app also supports role-based access control (RBAC), granting specific permissions to administrators and auditors for oversight and management purposes, ensuring that users with different roles have appropriate access levels based on their responsibilities. Built on a robust Zero Trust security framework, the application ensures that all access points are secure, utilizing JWT (JSON Web Token) authentication to verify the identity of each user, reducing the risk of unauthorized access.

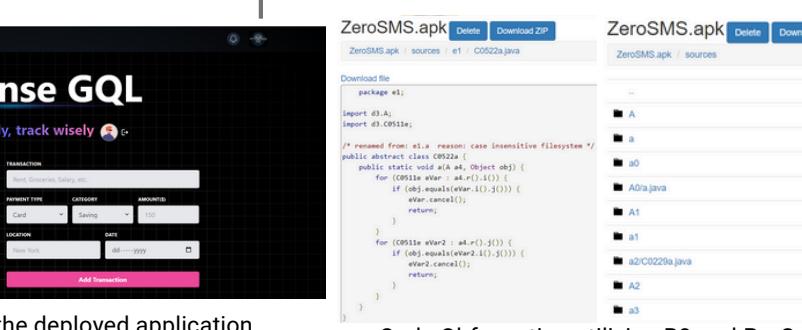

Root | Developer Options | Debugging detection using "JailMonkey" Library

ZeroSMS - Security score that is 83.87% higher than that of the standard APK in MobSF Scan

CONCLUSION

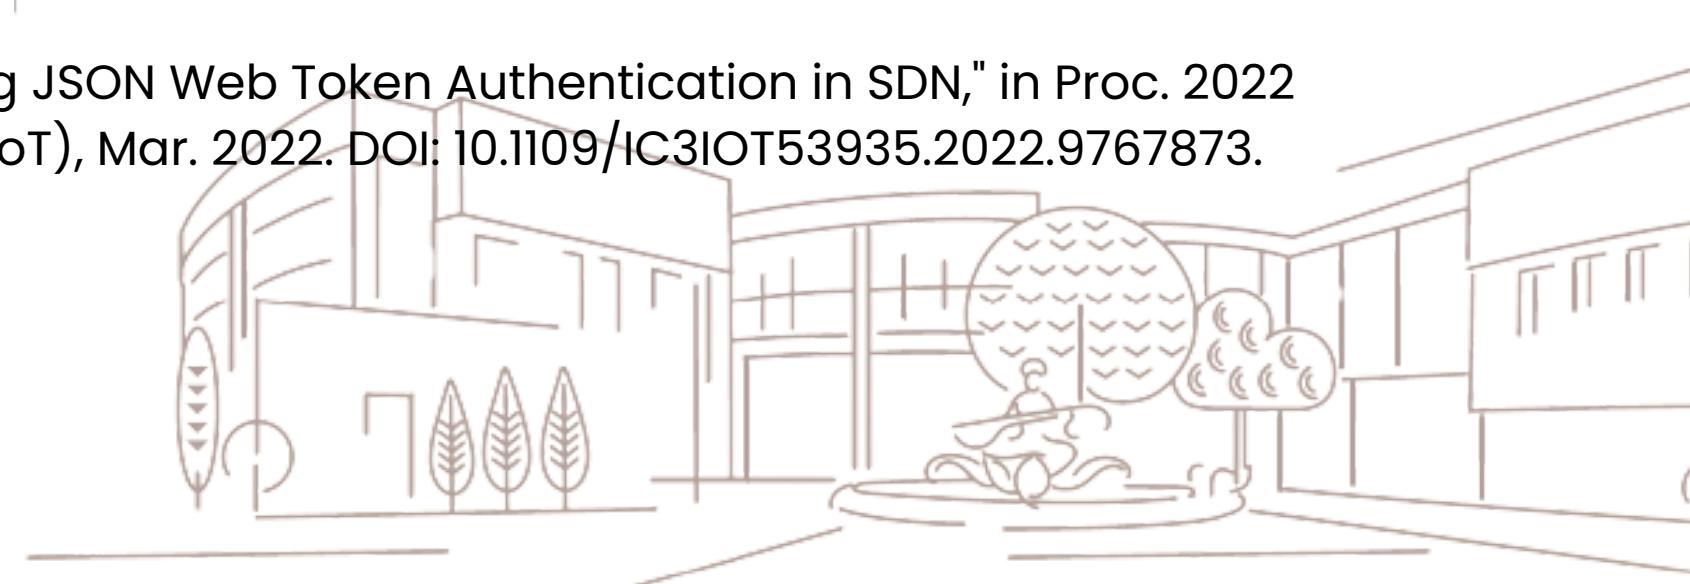

This project implemented the Zero Trust strategy to enhance the security of containerized environments through a proof of concept (PoC) that included a secure web app, Python API, and Android application. Key measures such as JWT authentication, continuous monitoring, mTLS, and RBAC were integrated to demonstrate effective Zero Trust principles. Future enhancements could focus on applying machine learning for anomaly detection, automating security audits, and integrating security into CI/CD pipelines. Additionally, training developers in Zero Trust practices and conducting real-world deployments will further improve security in containerized environments.

Code Obfuscation utilizing R8 and ProGaurd
